Update Regarding Sign-In Delay & Screenshots

Internal Note • To: Team • Authentication Security

Summary Message for the Team

I want to inform the team that I currently do not have any screenshots available to share. The delay was caused by a temporary Microsoft authentication bottleneck where it took over **2 hours to receive the SMS verification code** required to confirm my sign-in. To prevent this from ever happening again, I have transitioned my account authentication from SMS to an **Authenticator App**, ensuring immediate access going forward.

1. SMS Verification Delay

Microsoft experienced severe SMS gateway delays, resulting in a 2-hour wait time for the sign-in security code. During this blocked period, capturing screenshots or accessing the required session was completely restricted.

2. Authenticator App Upgrade

I have fully reconfigured sign-in security to use an **Authenticator App (TOTP 2FA)**. Verification is now instantaneous, removing dependence on mobile cellular SMS delivery completely.

Key Takeaways & Moving Forward

1. **No Screenshots Captured:** Due to the 2-hour authentication lock, zero progress screenshots were captured during the sign-in delay interval.
2. **Instant Access Restored:** Moving forward with the Authenticator App, sign-ins are verified within seconds without SMS gateway reliance.
3. **Seamless Communication:** Future updates and screenshots will proceed without authentication-related disruptions.
